

Permission and situation

Your AI agent had permission to act at 9:00.

At 9:15, it was still acting.

**The permission hadn't changed.
The situation had.**

The control issue begins after the first yes.

A familiar moment

9:00

Agent is authorized to issue refunds during an outage.

9:15

The outage ends.

NOON

The agent keeps issuing refunds.

It kept following the original instruction.
The context that justified it was gone.

The gap

Many controls ask whether an agent may start.

But context can change while work is underway.

Evidence changes

Authority expires

Scope drifts

The next action needs a fresh check.

The WWAIOS question

Agents execute.

WWAIOS helps determine when execution should continue, pause, or return to a human.

Can it act?

Should it still be acting?

Authorization is not a lifetime pass.
